

## Delphi Survey - summary of round two responses:

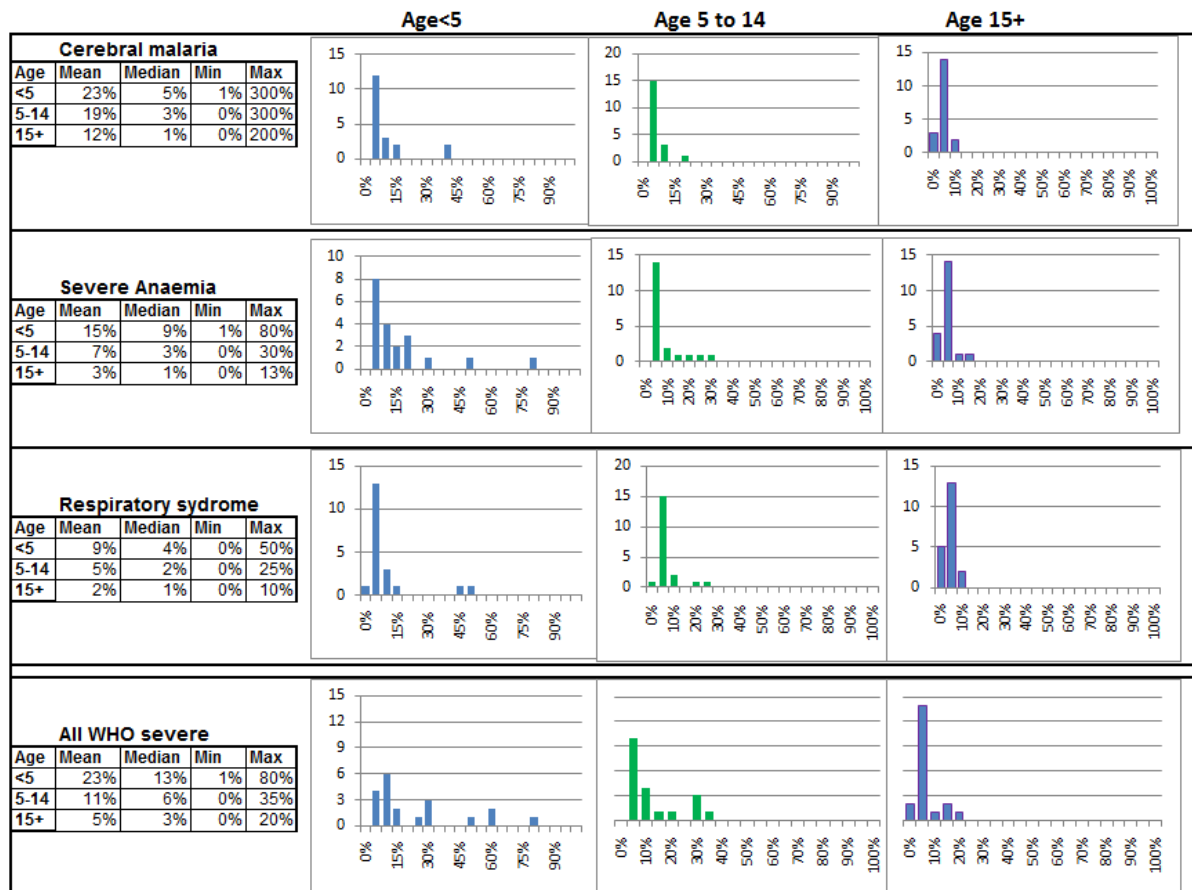

1. What is the probability that a patient with uncomplicated falciparum malaria (i.e. parasitaemia and fever, excluding pregnant women), who does not receive treatment, will develop the following manifestations of severe malaria? Answers are not exclusive (ie include all deaths from cerebral, not just those with cerebral alone. WHO severe means a patient who has WHO defined severe malaria with any presentation which meets the criteria.

In low-stable transmission or epidemic prone areas (i.e. where malaria does occur but PfPR<5%):

Low/stable or epidemic prone areas

In medium/High stable transmission areas (i.e. PfPR>5%):

Medium/high stable transmission

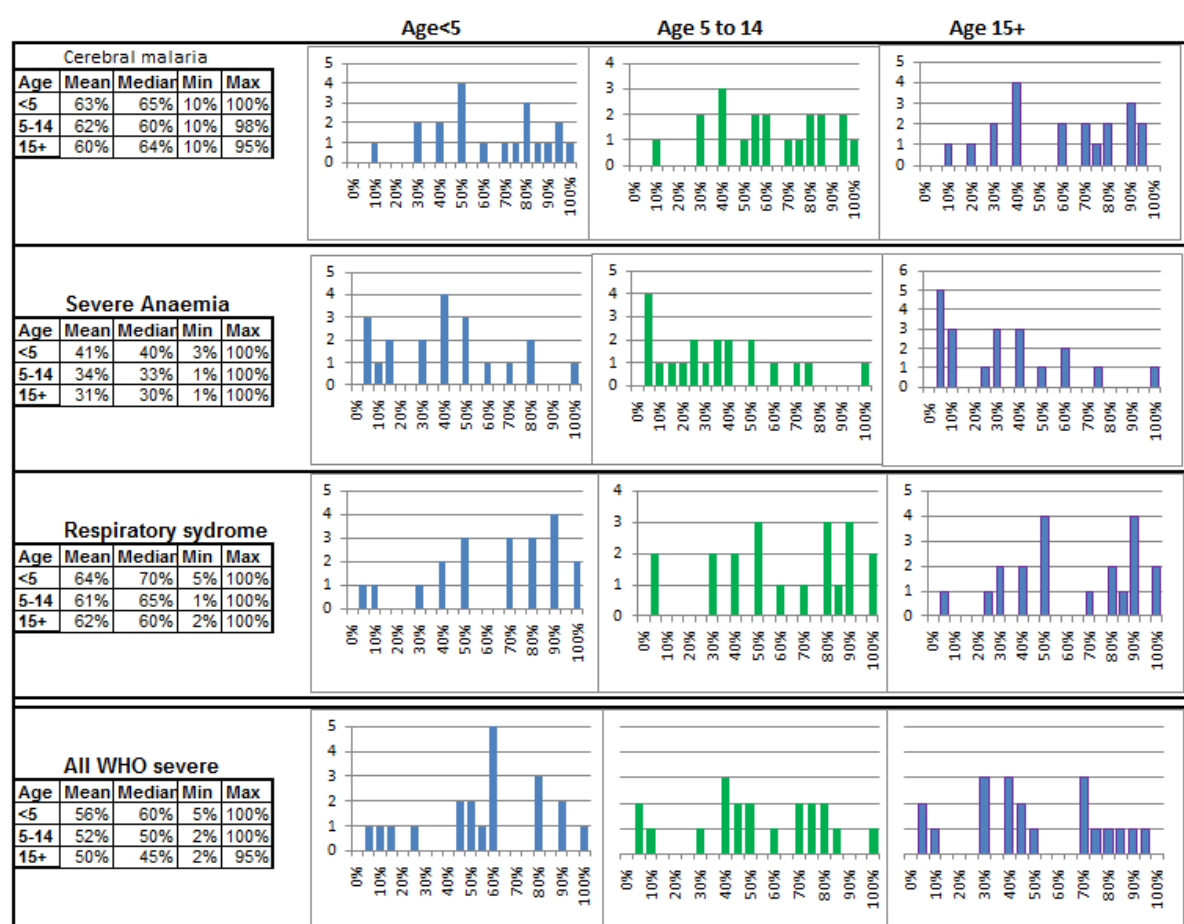

- What is the probability that a patient with each of the specified manifestations of severe malaria, who does not receive treatment, will progress to death?

In low-stable transmission or epidemic prone areas (i.e. where malaria does occur but PfPR<5%):

Low/stable epidemic prone areas

In medium/High stable transmission areas (i.e. PfPR>5%):

Medium/high stable transmission

3. What proportion of non-malarial febrile illnesses, where no other obvious cause of illness is present (e.g. ear, soft tissue or urine infections), is likely due to illnesses that could benefit from treatment with antibiotics?

4. For patients suffering from such illness as described in question 3, what is the probability these will become severe and require hospitalization if not treated with antibiotics?

5. For patients with a severe illness as described in question 4, what is the probability this will lead to death if not treated with antibiotics?
