In cases of normal distribution: variables are presented as mean (\pm SD). In cases of skewed distribution: variables are presented as median (interquartile range). Comparisons were performed among the three groups. ¹Kruskall-Wallis test; ²Fisher's exact test; ³Mann-Whitney test. *p<0.05 compared to control group with Mann-Whitney test or Fisher's exact test.

#For all data analysis (except for age, sex and current smokers) four patients on calcineurin inhibitor-based therapy are twice measured at different dates and contributed as independent values (34 patients, 38 cases). The term cases characterize all observations included these double measured values. &Less than ten non-missing values. ACE, angiotensin-converting enzyme; AT₁, angiotensin-II receptor; eGFR, estimated glomerular filtration rate; HDL, high-density lipoprotein; LDL, low-density lipoprotein; MMF, mycophenolate mofetil; RTx, kidney transplantation; SDF-1, stromal cell-derived factor-1 alpha. (n.a. = not applied; n.d. = not determined).
