

Figure S2. $\Delta 6$ and $\Delta 5$ desaturase activities are not involved in ACh-mediated vaso-relaxation.

Values are mean \pm SD (n = 6). (A) ACh +/- SC26196 in aortae; (B) ACh +/- SC26196 in mesenteric arteries. Statistical comparisons of effect of dose of inhibitor were by 1-Way ANOVA with Dunnett's *post hoc* test. Values significantly different from ACh treatment alone are indicated by *P<0.05, **P<0.01, ***P<0.001, ****, P<0.0001.
