

S4 Fig. Allele peak plot of chromosome arm 17p in the AML patient

Allele peak plot of chromosome arm 17p as assessed by CytoScan HD array in a peripheral blood sample of the patient AML. A homozygous AA genotype maps to approximately +1, a homozygous BB to approximately -1, a heterozygous AB to approximately 0 and a single A or B allele to 0.5 and -0.5, respectively. The allele peak plot indicates the loss of the chromosome 17p region in a subset of cells.
