S6 Fig: Mycobacterial alpha diversity between untreated (blue) and treated (orange) cases. X-axis = treatment group, Y-axis = diversity index value. Shannon Index ($P = 0.035$) and Observed richness ($P = 0.021$) were significantly lower in cases; there was no difference in Pielou's Evenness Index ($P = 0.091$) or Inverse Simpson's Index ($P = 0.166$).
