

Myocilin expression in Trabecular Meshwork Cells was analyzed following dexamathone treatment. After cells reach 70-80% confluency, HTMC cells were treated with 100nM and 500nM of dexamethasone for 6 days in DMEM with 1% FBS. Cell lysates were analyzed for Myocilin and beta-Actin expression by Western Blot.

## Myocilin expression in HTMC following dexamethasone treatment
