

S3

Wilting, Chlorosis, and Chlorophyll Content Index Data from the Greenhouse Trial

Table S3A. Estimated wilting levels (ranked 1-4, corresponding to 1–25%, 26–50%, 51–75%, 76–100% wilted, respectively) for four leaves (L1-L4) from each individual plant unit within each treatment group (water-resourcing level | initial soil RDX concentration) for eight plant species (*Antirrhinum majus*, *Dianthus*, *Hibiscus moscheutos*, *Plumbago auriculata*, *Pentas lanceolata*, *Ruellia caroliniensis*, *Salvia coccinea*, and *Tulbaghia violacea*).

Plant Species	Treatment Group	Unit	Wilt Level			
			L1	L2	L3	L4
<i>A. majus</i>	0.5X 0 ppm	1	1	1	1	1
<i>A. majus</i>	0.5X 0 ppm	2	1	1	1	1

Table S3C. Chlorophyll content index values (obtained with a CCM-200 plus chlorophyll content meter) for four leaves (L1-L4) from each individual plant unit within each treatment group (water-resourcing level | initial soil RDX concentration) for eight plant species (*Antirrhinum majus*, *Dianthus*, *Hibiscus moscheutos*, *Plumbago auriculata*, *Pentas lanceolata*, *Ruellia caroliniensis*, *Salvia coccinea*, and *Tulbaghia violacea*). For each leaf, one to three chlorophyll content index (*CCI*) measurements were made (depending on leaf surface area) using a CCM-200 plus chlorophyll content meter (Opti-Sciences, Inc.; Hudson, NH, USA). Either a single *CCI* value or mean leaf *CCI* was recorded for each leaf. *CCI* is the product of percent light transmittance at 931 nm and the inverse of the percent light transmittance at 653 nm. While not equivalent to actual density of chlorophyll in plant tissues, *CCI* provides a useful metric for comparing chlorophyll content among different samples. “--” denotes a missing datum.

Plant Species	Treatment Group	Unit	<i>CCI</i>			
			L1	L2	L3	L4
<i>A. majus</i>	0.5X 0 ppm	1	4.3	2	2.5	2.8
